Ever wonder what WordPerfect would be like with an additional eight extra windows within which to work? Well, you need wonder no longer because that is exactly what, in effect, you get with WP51 WINDOWS. Using WP 5.1's Endnote Feature, WP51 WINDOWS gives you eight additional workspaces to which you may retrieve documents, save documents, and cut and paste documents. Though a few of WP's features are not available in the windows, for the most part, they are all of them there for use in all TEN documents.

WP51 WINDOWS "splits" the Document 1 editing screen effectively into nine (9) distinct documents so that you may work with more than just two documents, and not just with one document in each document editing screen.

#### USING WP51 WINDOWS

WP51 WINDOWS is controlled by the included WINDOWS.WPM macro, which should be installed in your macro directory as specified in Setup ([Shift-F1]), Location of Files [7], Keyboard/Macro files [3]; if no such directory has been specified in Setup, then this macro can be copied to your current directory or to the directory where WP.FIL resides. It may also be renamed to Alt-W (or something more appropriate, if you wish).

WP51 WINDOWS must be invoked from an empty Document 1 editing screen. If not, the prompt "Document screen must be empty before setting windows" will display momentarily. When the way has been "cleared" for the setting up of the "windows," the prompt:

Set windows? (Y/N) Yes

will display. Any key other than an explicit No ("N" or "n") will move WP51 WINDOWS into action.

Your cursor will be placed in a window labeled "Window #<<1>>" in reverse video on the WP status line, identifying the first of nine windows out of which you may enter and from which you may work. Note that a few keys have been redefined for use with WP51 WINDOWS:

` (grave)	Hot key for switching from one window to another
Ctrl-P	Lets you know what page you are on
Ctrl-Enter	Emergency abort key to exit

The Shift-F3 (Switch) key is also redefined, and is used whenever you'd like to print something from a window without exiting WP51 WINDOWS (something that cannot be done from Endnotes anyway). The prompt "Press Shift-F3 to return to Windows" displays to remind you, although you have virtually full use of WP's capability when you have entered the Document 2 editing screen, that there are windows active within which may be vital data you'd dare not forget to save.

To switch from window to window, just press the ` key. At the prompt:

## "Switch to Window #"

you simply input any number from 1 to 9. While inside of WP51 WINDOWS, the status line will indicate the number of the window then active. Alternatively, pressing ENTER makes the next consecutively numbered window the active window. Pressing any key other than those within the range 1 through 9 and ENTER) is largely ignored by WP51 WINDOWS. I say "largely" because Ctrl-Enter aborts the macro altogether, which will not affect the information contained in the windows, but will require manually entering each of the endnote windows to save (or retrieve) text therefrom.

The Exit ([F7]) and Save ([F10]) keys have been redefined a bit, so that within WP51 WINDOWS you may save information from a window and/or exit that window. The prompts associated with the redefinitions of these keys will be readily grasped by users as they emulate WP 5.1's prompts. The Cancel ([F1]) key has also been redefined so that it will not cancel macro execution (its normal function), but will allow use of WP's Undelete Feature.
