

Replace Hard Returns with Spaces  
WPUniverse.com  
By Chris Scott

If you have blocked some text, run the included WRAP.WPM macro to replace all hard returns [HRT] with spaces, then replace all double spaces with single spaces. This works well on text imported from PDF files, some text files, some web sites, etc.

If no text has been blocked, the macro asks you if you want to wrap from where cursor sits. This tends to get rid of all paragraphs, so one must have a way to tell where paragraphs are.

*Note: If paragraphs are already separated by two hard returns instead of one, you can replace those hard returns with garbage characters such as @@@@, then run the macro. Afterwards, replace the garbage characters with two hard returns and all should be well.*
